

I sell Q&A

 **Q1 : prog_venc 报parse_multi_decoder_param[2646]: is filePath=input1.es,val_c="input1.es"错误 ?**

It should be that the source file has not been obtained. Check whether there is a corresponding encoding source file in the directory passed by yuv_path in the configuration file. Refer to the how to run venc demo document in the source directory to configure the .json file.

 **Q2: Which demo should the sensor input be encoded to the file by h265/h264 encode/jpeg?**

Refer to the vpe demo, which contains the entire process of sensor->vif->isp->scl->venc->file. For specific use, please refer to the vpedemo instruction document in the sdk.
