

Image Q&A

 **Q1: Burn image to SSD268G black development board with tftp, should estar choose 4layer board or 6layer board?**

Choose 4layer.

 **Q2: Why is the usb_updater.bin file compiled by make_usb_upgrade_sigmaster.sh under the project very large, and it cannot be burned to usb, but the SDK decompressed is very small?**

These two files are not the same thing. The usb_updater.bin in the usb upgrade tool is similar to the function of our ipl iplcsdust.

 **Q3: Does SSD268G have similar factory firmware?**

Yes, there are different versions of images under the SDK, choose the image that matches your board version to burn.
