

Misc Q&A

Q1: The Init Config failed error appears when running the mixer?

The 268 version of the mixer input parameter is a json configuration file, and the streaming process and parameters are set in the parameter file.

Q2: Can't insert xxx.ko:unknown symbol in module or invalid parameter error appears during insmod?

Use the dmesg command to see which symbols are missing. It should be that some modules of the kernel are not enabled.

Q3: The RMII interface does not work properly. It is possible to send data packets when the packet is captured, but the board cannot receive the response packet?

For hardware wiring problems, the connection line between the external phy and the development board should be as short as possible.

Q4: Can the PQ tool connect to the board only by I2C-USB connection? If I choose the I2C-USB method, do I need to use the debug board of the sigmastar platform?

Currently only supports I2C-USB connection. The I2C-USB connection method must use the debug board of the sigmastar platform.
