

UI Q&A

 **Q1: The source code of Flythings downloaded from github compiles zkgui and copies it to run under the customer, but the screen does not light up?**

Instead of copying zkgui directly to the customer to run, you also need to package the gui env to the image through alkaid. There is no application under Verify, you need to create it yourself, and then put the zkgui environment folder in it. For specific operations, please refer to the UI environment construction of sigdoc. The document is described with an example. The specific path needs to be modified according to the actual project.
